

Q9)

$$d = 0.011$$

$$mgh + \frac{1}{2}kx^2 = \frac{1}{2}mv_i^2$$

$$\frac{\frac{1}{2}mv_i^2 - mgh}{\frac{1}{2}d^2}$$

$$0.011$$

$$k = \frac{mv_i^2 - 2mgh}{(d)^2}$$

$$v_{ix} = \frac{(\Delta x - D)}{t}$$

$$v_{2x} = \frac{\Delta x}{t}$$

$$mgh + \frac{1}{2} \left(\frac{m \frac{(\Delta x - D)^2}{t^2} - 2mgh}{d^2} \right) x^2 = \frac{1}{2} m \frac{\Delta x^2}{t^2}$$

$$mgh + \left(\frac{m(1.93)^2}{2t^2 d^2} - \frac{mgh}{d^2} \right) x^2 = \frac{1}{2} m \frac{\Delta x^2}{t^2}$$

$$\Delta x = 2.2m$$

$$D = 0.27m$$

We know

$$\Delta x \quad D$$

$$g$$

$$\Delta x = v_0 t + \frac{1}{2} a t^2$$

$$v = v_0 + at$$

$$v^2 = v_0^2 + 2a\Delta x$$

$$\Delta x = \frac{(v + v_0)t}{2}$$
